

Heat Dissipation in a Custom Molded Seating System

Lynore McLean, B.Sc.P.T.

Irene Schmid, B.A. Industrial Design, M.A. Economics

International Seating Symposium 2016

Paper Presentation

March 2016, Vancouver

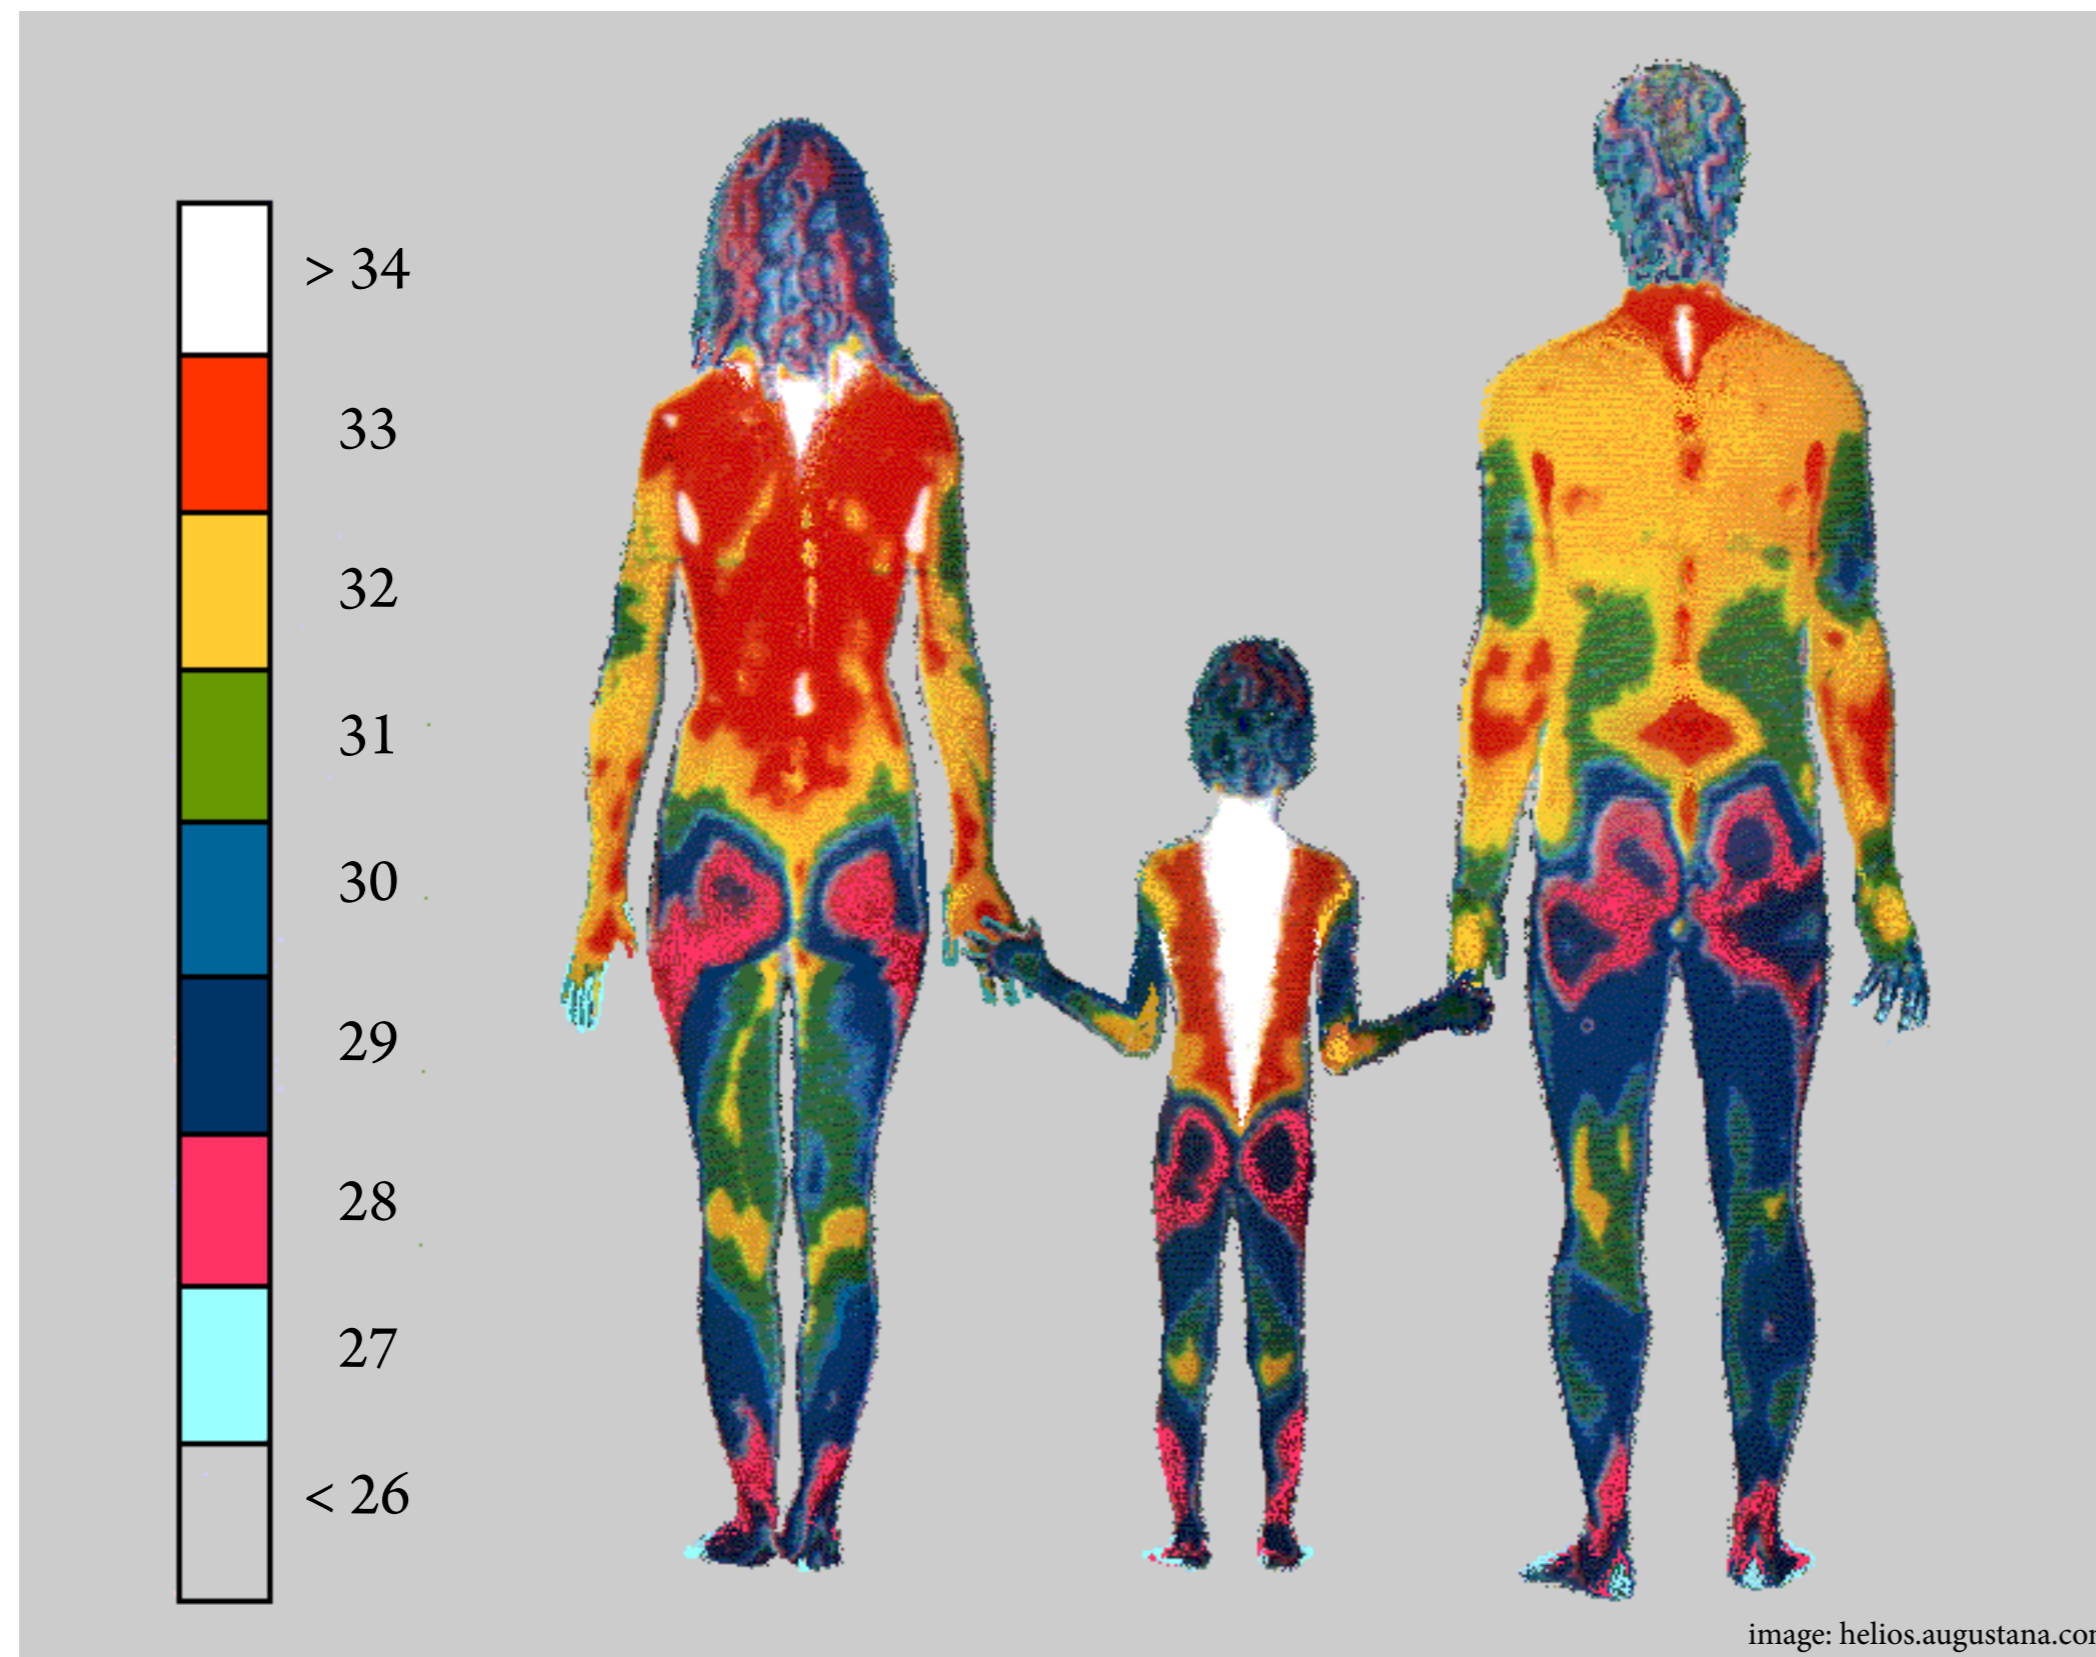

Contact: lmclean3@cw.bc.ca

Purpose

Improve body heat dissipation
for clients positioned in
custom molded foam seating
systems

Heat Build-up in Seating System

30% of
body in
contact with
seating system

Current Practice

3-D Spacer-mesh

Literature Search Strategy

Cut-off: November 2015

Terms: Heat and/or Moisture and Seat*

Sources: Academic: Google Scholar; EBM Review; CINAHL;
PubMed; Embase

Industry publications (incl. ROHO, Ride)

ISO standards, Patents, Engineering literature

Literature Search Yield

Not a new problem for healthcare, automotive, aerospace

ISO 16840 (2014) = test method for measuring perspiration dissipating characteristics of wheelchair cushions

Application in custom-built seating environments?
price, production scale, technological complexity

Experiment Protocol: Measuring Temperature

Bedford Scale

- +3 Much too warm
- +2 Too warm
- +1 Comfortably warm
- 0 Neutral
- -1 Comfortably cool
- -2 Too cool
- -3 Much too cool

Experiment Protocol

10 x

30 x

Experiment Protocol

Results: Graph

Degrees
Celcius

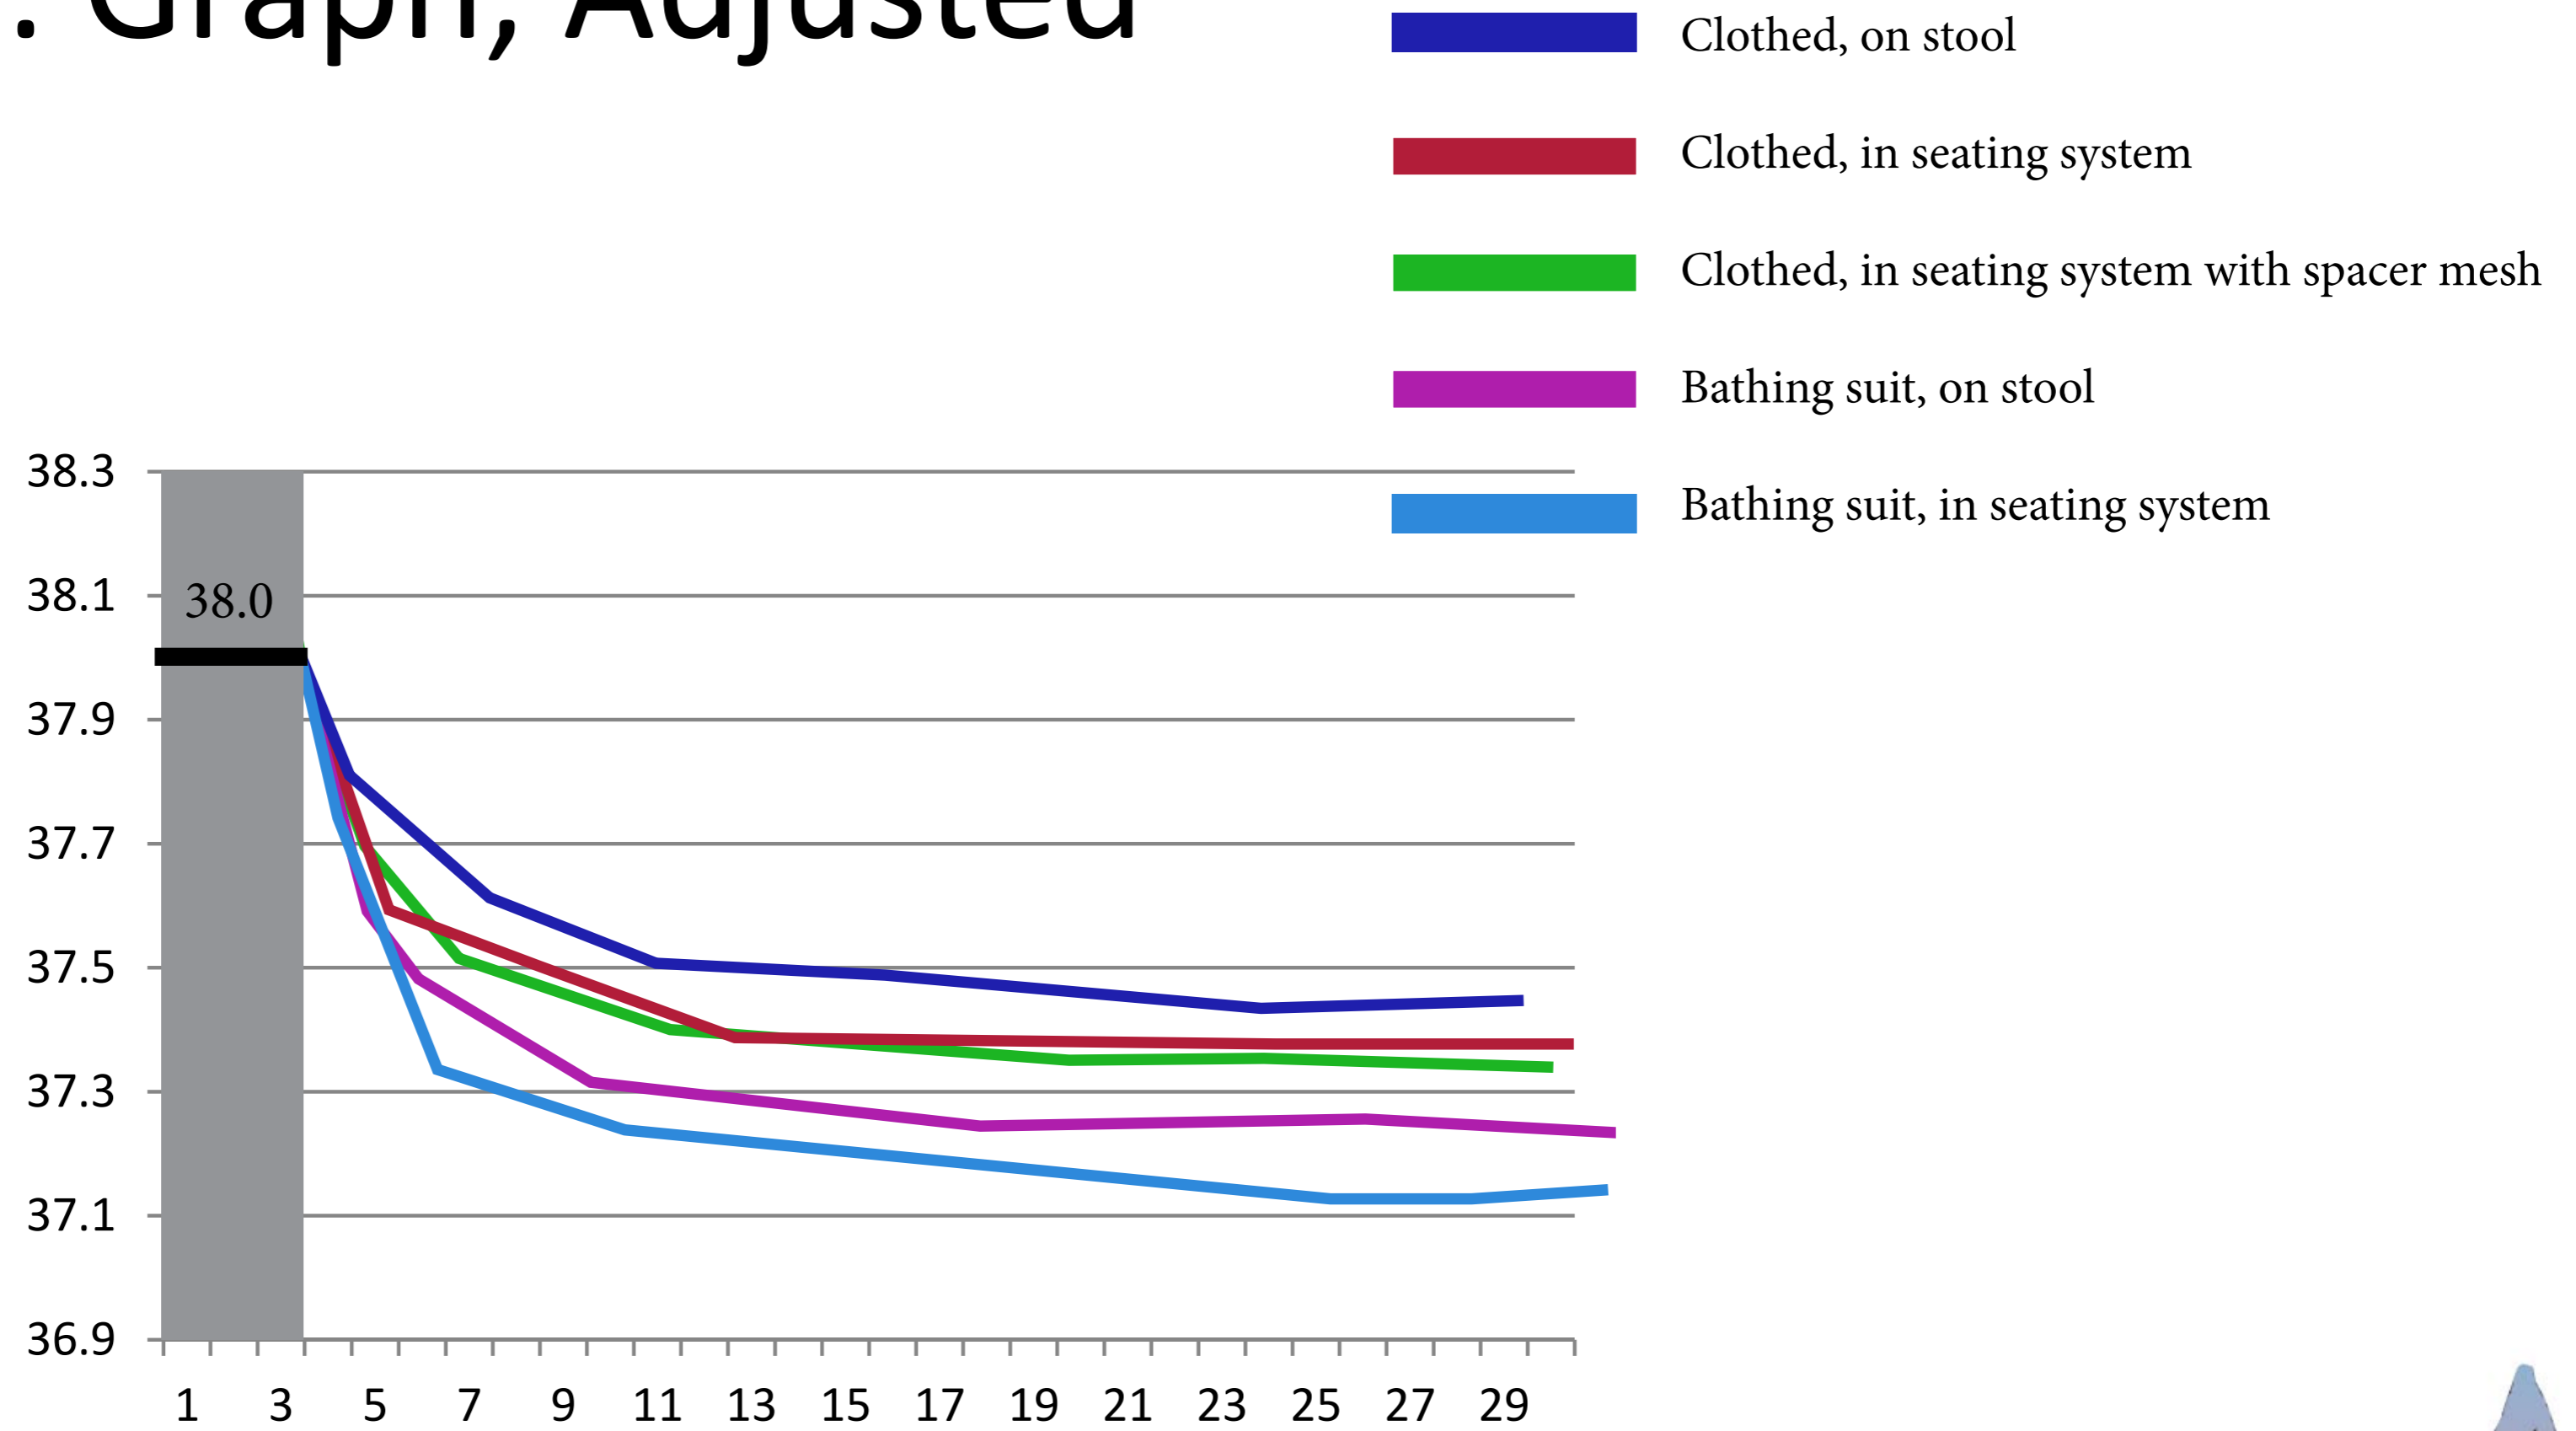

Minutes

Results: Graph, Adjusted

Degrees
Celcius

Minutes

Results: Analysis

Body = 38 deg C

Seat = 23 deg C

Conclusions

Spacer mesh did not make a discernable difference

Are results clinically useful ?

Is testing methodology viable?

Focus on local or global heat management ?

Reflections

3-D Spacer mesh +
Convection =
Airflow

Further Research Directions

Ongoing Innovation at Sunny Hill

Water flow

Cold Rush by Ossur

Perforated padded shell

Discussion & Questions
